Chapter 8. Normalization of the data structure using E-R

Nguyen Thi Thu Trang trangntt-fit@mail.hut.edu.vn

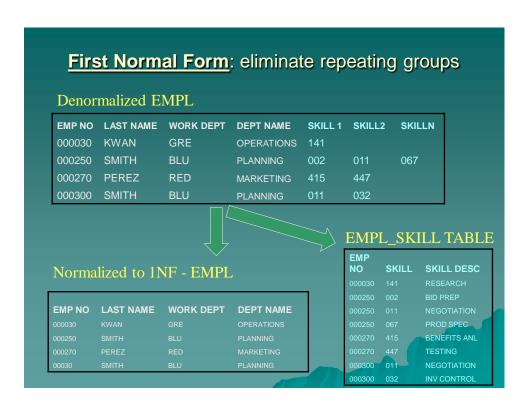

Design with Normalization

 Normalization: the process of steps that will identify, for elimination, redundancies in a database design.

Normalization Forms

- ◆ <u>First Normal Form</u>: eliminate repeating groups
 → repeating items within an entity are brought out as independent entity.
- ◆ <u>Second Normal Form</u>: eliminate columns (attributes) that depend only on parts of the primary key → the items depending on only some parts of composite key are brought out as independent entity
- ◆ Third Normal Form: eliminate columns that don't depend on the primary key at all → the items depending on non-primary key or items are brought out as independent entity.

Third Normal Form: eliminate columns that don't depend on the key at all Denormalized EMPL

EMP NO	LAST NAME	WORK DEPT	DEPT NAME	MGRNO
000030	KWAN	GRE	OPERATIONS	000080
000250	SMITH	BLU	PLANNING	000010
000270	PEREZ	RED	MARKETING	000020
000300	SMITH	BLU	PLANNING	000010

Normalized to 3NF

"Register for course" use case

- Make the E-R diagram from the previous step for "Register for course" use case to become:
 - The first normal form
 - The second normal form
 - The third normal form
